

# Networks, Graphs and Algorithms

*GANG* (of Networks)

INRIA Paris Rocq. - LIAFA (Paris Diderot Univ., CNRS)

Laurent Viennot

# Team Members

## INRIA

- Laurent Viennot (DR)
- Dominique Fortin (CR)
- Fabien Mathieu (R)

## CNRS

- Pierre Fraigniaud (DR)
- Amos Korman (CR)

## Paris Diderot University

- Yacine Boufkhad (MdC)
- Pierre Charbit (MdC)
- Fabien de Montgolfier (MdC)
- Carole Delporte (Prof)
- Hugues Fauconnier (MdC)
- Michel Habib (Prof)

## PhD Students

- Heger Arfaoui
- Hervé Baumann
- Jérémie Dusart
- Xavier Koeqler
- Antoine Mamcarz
- Hung Tran-The

## Administrative assistant

- Christine Anocq

# Goals

- Theory of networks
- Algorithms for networks

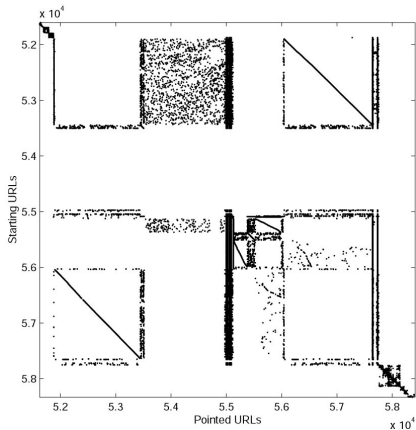

# Challenges

- Networks get larger and larger
- Manage large scale mobility : fusion of Internet and radio networks
- Massively distributed applications : between cloud and P2P

# Approach

- Identify inherent structures in networks or applications to derive efficient algorithms.
- Bring powerful theoretical tools toward practice.

# Web Adjacency Matrix

# P2P Network (Gnutella)

# Ad hoc network, Large Scale Internet?

# More networks

- Social networks
- Biological networks
- Dependencies in Linux packages
- Road networks

# Scientific Foundations

- Graph theory
- Theory of distributed computing

# Graph Theory

- Extremal graph theory
- Random graphs
- Structured graphs (de Bruijn, hypercube, ...)
- Graph decomposition (treewidth, treelength, ...)
- Metric properties (doubling, hyperbolic, ...)

# Theory of Distributed Computing

- Locality issues (synchronous)
  - LOCAL and CONGEST models
  - Spanners
  - Informative labeling schemes
- Fault tolerance issues (asynchronous)
  - Shared memory and message passing models
  - Impossibility of consensus
  - Herlihy like hierarchies

# Fundamental example

## Question

- How much information is required to estimate  $d(u, v)$ ?

## Distance labeling

- Give labels  $L(u), L(v)$  such that  $d(u, v) \approx f(L(u), L(v))$ .
- Size of labels vs accuracy of distance estimations?

## Theorem [Slivkins'05]

- If  $d$  is a doubling metric then polylogarithmic labels allow to approximate distances within a factor  $1 + \epsilon$ .

# Fundamental example

## Question

- How much information is required to estimate  $d(u, v)$ ?

## Distance labeling

- Give labels  $L(u), L(v)$  such that  $d(u, v) \approx f(L(u), L(v))$ .
- Size of labels vs accuracy of distance estimations?

## Theorem [Slivkins'05]

- If  $d$  is a doubling metric then polylogarithmic labels allow to approximate distances within a factor  $1 + \epsilon$ .

## *GANG* Achievements

## For short

- Papers : PODC, STOC, FOCS, SODA, INFOCOM, ESA, ICALP, DISC,...
- A startup (OSEO Grant 2008)

## Some facts

- Internet has doubling dimension  $\approx 1.2$ .
- Internet has treewidth  $\geq 80$ .
- Facebook graph has diameter 41.

# Objectives

- Large networks
- Decentralized content distribution
- Graph algorithms
- Distributed computing

# Large Networks : Structure of Internet

- Internet delays as an Inframetric with low doubling dimension.

[Fraigniaud, Lebhar, Viennot, INFOCOM'08]

- Treewidth and hyperbolicity of Internet.

[de Montgolfier, Soto, Viennot, NCA'11]

# Estimating distances in Internet

## Distance measure

- $d(u, v) = \text{RTT}(u, v)$  (ping time from  $u$  to  $v$ )

## Question

- Is this a doubling metric?

## Polynomial balls

- $B(u, r) = \{v : d(u, v) \leq r\}$
- Doubling dimension  $a$  :  
 $B(u, 2r)$  can be covered by  $2^a$  balls of radius  $r$ .
- Particular case :  $|B(u, 2r)| \leq 2^a |B(u, r)|$ .

# Estimating distances in Internet

## Distance measure

- $d(u, v) = \text{RTT}(u, v)$  (ping time from  $u$  to  $v$ )

## Question

# Answer

No

- Not a metric : triangular inequality is often violated.
- No polynomial growth of balls.
- Doubling dimension appears to be high.

But

- $\rho$ -inframetric :  $d(u, v) \leq \rho \max\{d(u, w), d(w, v)\}$  ( $\rho \approx 4$ ).
- Doubling' dimension  $\alpha \approx 1.2$  :  
 $B(u, r)$  can be covered by  $O(r^{1.2})$  unit balls.

Result

- Theorem' : if  $d$  is a  $\rho$ -inframetric with doubling' dimension  $\alpha$ , polylogarithmic labels allow to estimate distances within a factor  $(1 + \varepsilon)\rho$ .

# Answer

## No

# Perspectives

# Objectives

- Graph algorithms
- P2P approach to future content distribution
- Distributed computing

# Graph Algorithms

- Study the power of graph searching on networks and graphs.
- Analyze some biological networks (clustering, compression, ...)
- Study approximations for consecutive ones property of matrices.

# Graph Algorithms : Multi-sweep Methods

- Graph searching as a generic building block.
- Combine searches : the ordering produced by a search can be used to break ties in the next search.
- Explore searching procedures based on ordering properties : BFS, DFS, LexBFS, LexDFS, LexUp, LexDown,...

# P2P Approach to Future Content Distribution

- P2P distribution vs content centric networking.
- Models where the bandwidth bottleneck is at the core of the network.
- P2P storage and caching allocation : interplay between CDNs, clouds and P2P.

# Distributed Computing

- Explore distributed decision problems.
- Algorithms with oracles (failure detectors, a priori information).
- Non determinism in distributed computing.
- New computational paradigms such as distributed quantum computing.

# Distributed Computing : Fault Tolerant Data Structures

- Estimate  $d(u, v, F) = d_{G-F}(u, v)$ .
- Fault tolerant spanners.
- Fault tolerant routing.
- Forbidden set labeling :  
 $d(u, v, F) \approx f(L(u), L(v), \{L(x) : x \in F\})$ .
- A new approach to amortized dynamic algorithms : add changes to  $F$ , recompute the data structure when  $F$  is too big.
